

1 ABSTRACT OF THE DISCLOSURE

2 A deposition method includes forming a nucleation layer over a
3 substrate, forming a layer of a first substance at least one monolayer
4 thick chemisorbed on the nucleation layer, and forming a layer of a
5 second substance at least one monolayer thick chemisorbed on the first
6 substance. The chemisorption product of the first and second substance
7 may include silicon and nitrogen. The nucleation layer may comprise
8 silicon nitride. Further, a deposition method may include forming a first
9 part of a nucleation layer on a first surface of a substrate and forming
10 a second part of a nucleation layer on a second surface of the substrate.
11 A deposition layer may be formed on the first and second parts of the
12 nucleation layer substantially non-selectively on the first part of the
13 nucleation layer compared to the second part. The first surface may be
14 a surface of a borophosphosilicate glass layer. The second surface may
15 be a surface of a rugged polysilicon layer. The first and second part
16 of the nucleation layer may be formed simultaneously.
